

University of Tehran

Tehran

School of Electrical and Computer Engineering

Course Description

Computer Engineering

Bachelor's Degree

Remarks:

According to the Academic Instruction of the University, in the academic system, each Theoretical credit is presented in 16 hours, each Practical credit in 32 hours, and each Workshop credit in 48 hours.

There are some different types of courses passed by a bachelor/master/Ph.D. student at this university, as listed below:

1. Basic
2. Major
3. Specialized
4. Elective
5. General
6. Workshop
7. Internship
8. Project

Each of these types contains some courses to be passed according to the educational regulations passed by the Ministry of Science, Research and Technology or the Ministry of Health & Medical Education of Iran.

The grading system in this university is from 0 to 20. The minimum passing grade for a course leading to an Associate's Degree or a Bachelor's Degree is 10, for a course leading to a Master's Degree and Medical Sciences is 12, and for a course leading to a Ph.D. Degree is 14.

Title of the Course: Physics 1
Number of Credits: 3
Type of the Course: Basic | Theoretical
Training hours: 48h Theoretical

Course Objectives:

The main goal of fundamental courses in physics is to provide tools by which students can learn how to read scientific material effectively, identify fundamental concepts, reason through scientific questions, and solve quantitative problems. Physics 1 is the first course of this set. This course covers the fundamental concepts in Classical Mechanics and Thermodynamics.

Syllabus of Courses:

- Units, Physical Quantities, and Vectors:

The Nature of Physics, Solving Physics Problems, Standards and Units, Unit Consistency and Conversions, Uncertainty and Significant Figures, Estimates and Orders of Magnitude, Vectors and Vector Addition, Components of Vectors, Unit Vectors, Products of Vectors

- Motion along a Straight Line:

Displacement, Time, and Average Velocity, Instantaneous Velocity, Average and Instantaneous Acceleration, Motion with Constant Acceleration, Freely Falling Bodies, Velocity and Position by Integration

- Motion in Two or Three Dimensions:

Position and Velocity Vectors, The Acceleration Vector, Projectile Motion, Motion in a Circle, Relative Velocity

- Newton’s Laws of Motion:

Force and Interactions, Newton’s First Law, Newton’s Second Law, Mass and Weight, Newton’s Third Law, Free-Body Diagrams

- Applying Newton’s Laws:

Using Newton’s First Law: Particles in Equilibrium, Using Newton’s Second Law: Dynamics of Particles, Frictional Forces, Dynamics of Circular Motion, The Fundamental Forces of Nature

- Work and Kinetic Energy:

Work, Kinetic Energy, and the Work-Energy Theorem, Work and Energy with Varying Forces, Power

- Potential Energy and Energy Conservation:

Gravitational Potential Energy, Elastic Potential Energy, Conservative and Non-conservative Forces, Force and Potential Energy, Energy Diagrams

- Momentum, Impulse, and Collisions:

Momentum and Impulse, Conservation of Momentum, Momentum Conservation and Collisions, Elastic Collisions, Center of Mass, Rocket Propulsion

- Rotation of Rigid Bodies:

Angular Velocity and Acceleration, Rotation with Constant Angular Acceleration, Relating Linear and Angular Kinematics, Energy in Rotational Motion, Parallel-Axis Theorem, Moment-of-Inertia Calculations

- Dynamics of Rotational Motion:

Torque, Torque and Angular Acceleration for a Rigid-Body, Rigid-Body Rotation About a Moving Axis, Work and Power in Rotational Motion, Angular Momentum, Conservation of Angular Momentum, Gyroscopes, and Precession

- Equilibrium and Elasticity:

Conditions for Equilibrium, Center of Gravity, Solving Rigid-Body Equilibrium Problems, Stress, Strain, Elastic Moduli, Elasticity, and Plasticity

- Fluid Mechanics:

Density, Pressure in a Fluid, Buoyancy, Fluid Flow, Bernoulli’s Equation, Viscosity, and Turbulence

- Gravitation:

Newton’s Law of Gravitation, Weight, Gravitational Potential Energy, The Motion of Satellites, Kepler’s Laws and the Motion of Planets, Spherical Mass Distributions, Apparent Weight and the Earth’s Rotation, Black Holes

- Periodic Motion:

Describing Oscillation, Simple Harmonic Motion, Energy in Simple Harmonic Motion, Applications of Simple Harmonic Motion, The Simple Pendulum, The Physical Pendulum, Damped Oscillations, Forced Oscillations, and Resonance

- Temperature and Heat:

Temperature and Thermal Equilibrium, Thermometers and Temperature Scales, Gas Thermometers and the Kelvin Scale, Thermal Expansion, Quantity of Heat, Calorimetry and Phase Changes, Mechanisms of Heat Transfer

- Thermal Properties of Matter:

Equations of State, Molecular Properties of Matter, Kinetic-Molecular Model of an Ideal Gas, Heat Capacities, Molecular Speeds, Phases of Matter

- The First Law of Thermodynamics:

Thermodynamic Systems, Work Done During Volume Changes, Paths Between Thermodynamic States, Internal Energy and the First Law of Thermodynamics, Kinds of Thermodynamic Processes, Internal Energy of an Ideal Gas, Heat Capacities of an Ideal Gas, Adiabatic Processes for an Ideal Gas

- The Second Law of Thermodynamics:

Directions of Thermodynamic Processes, Heat Engines, Internal-Combustion Engines, Refrigerators, The Second Law of Thermodynamics, The Carnot Cycle, Entropy, Microscopic Interpretation of Entropy

TextBooks:

1. Fundamentals of Physics, David Halliday, Jearl Walker, Robert Resnick, 10th edition

Title of the Course: Calculus 1
Number of Credits: 3
Type of the Course: Basic | Theoretical
Training hours: 48h Theoretical

Course Objectives:

Calculus 1, consisted principally of one-variable Calculus, Functions, Derivatives, Integrals, Integration Methods, Complex Numbers, and Infinite Series.

Syllabus of Courses:

Cartesian coordinates; polar coordinates; complex numbers; addition, product, root & geometrical representation of complex numbers; polar representation of complex numbers; function; functions algebra; limit and relevant theorems; infinite limit and limit in infinite; left-hand and right-hand limit; connectivity; derivative; derivation formula; inverse function and its derivative; trigonometric functions derivative and their inverse functions; Rolle's theorem; mean theorem; Taylor expansion; geometrical and physical applications of derivative; curves and acceleration in polar coordinates; application of derivative in approximation of equations roots; definition of integral of continuous functions and piecewise continuous; basic theorems of differential & integral arithmetic; primitive function; approximate methods of integral estimate; application of integral in computation of area, length of curve, moment, center of gravity and labor ….(in Cartesian and polar coordinates); logarithm and exponential function and their derivative; hyperbolic functions; integration methods such as change of variable, component and decomposition of fractions; transform of special variables of sequence and numerical series and relevant theorems; power series and Taylor theorem with remainder.

TextBooks:

1. Tom M. Apostol, "Calculus, Vol. 1: One-Variable Calculus, with an Introduction to Linear Algebra", John Wiley, 2012.
2. George B. Thomas Jr., Maurice D. Weir, Joel Hass, "Thomas' Calculus (12th Edition)", 2009

Title of the Course: Differential Equations
Number of Credits: 3
Type of the Course: Basic | Theoretical
Pre-requisite: Calculus 1
Training hours: 48h Theoretical

Course Objectives:

In this course, the first and second levels of linear differential equations and some nonlinear differential equations will be introduced, in addition, students will learn about some numerical and analytical ways to solve Mathematical Problems.

Syllabus of Courses:

- Introduction

Some Basic Mathematical Models, Direction Fields, Solutions of Some Differential Equations, Classification of Differential Equations, Historical Remarks

- First Order Differential Equations

Linear Equations with Variable Coefficients, Separable Equations, Modeling with First Order Equations, Differences between Linear and Nonlinear Equations, Autonomous Equations and Population Dynamics, Exact Equations and Integrating Factors, The Existence and Uniqueness Theorem, First Order Difference Equations

- Second Order Linear Equations

Homogeneous Equations with Constant Coefficients, Fundamental Solutions of Linear Homogeneous Equations, Linear Independence and the Wronskian, Complex Roots of the Characteristic Equation, Repeated Roots, Reduction of Order, Nonhomogeneous Equations, Method of Undetermined Coefficients, Variation of Parameters.

- Higher Order Linear Equations

General Theory of nth Order Linear Equations, Homogeneous Equations with Constant Coefficients, The Method of Undetermined Coefficients, The Method of Variation of Parameters

- Series Solutions of Second-Order Linear Equations

Review of Power Series, Series Solutions near an Ordinary Point, Regular Singular Points, Euler Equations, Series Solutions near a Regular Singular Point, Bessel’s Equation

- The Laplace Transform

Definition of the Laplace Transform, Solution of Initial Value Problems, Step Functions, Differential Equations with Discontinuous Forcing Functions, Impulse Functions, and The Convolution Integral

- Systems of First-Order Linear Equations

Introduction, Review of Matrices, Systems of Linear Algebraic Equations; Linear Independence, Eigenvalues, Eigenvectors, Basic Theory of Systems of First Order Linear Equations Homogeneous Linear Systems with Constant Coefficients, Complex Eigenvalues, Fundamental Matrices, Repeated Eigenvalues,

TextBooks:

1. E. Kreyszig, Advanced Engineering Mathematics, 1999
2. P. Blanchard, R.L. Devaney, and Co. Hall, Differential Equations, 1st Edition, Brooks/ColePub, 1998

Title of the Course: Physics 2
Number of Credits: 3
Type of the Course: Basic | Theoretical
Pre-requisite: Physics 1
Training hours: 48h Theoretical

Course Objectives:

The main goal of fundamental courses in physics is to provide tools by which students can learn how to read scientific material effectively, identify fundamental concepts, reason through scientific questions, and solve quantitative problems. Physics 2 is the second course of this set. This course covers the fundamental concepts of Electromagnetism.

Syllabus of Courses:

- Electric Charge and Electric Field:

Electric Charge, Conductors, Insulators, and Induced Charges, Coulomb's Law, Electric Field and Electric Forces, Electric-Field Calculations, Electric Field Lines, Electric Dipoles

- Gauss's Law:

Charge and Electric Flux, Calculating Electric Flux, Gauss's Law, Applications of Gauss's Law, Charges on Conductors

- Electric Potential:

Electric Potential Energy, Electric Potential, Calculating Electric Potential, Equipotential Surfaces, Potential Gradient

- Capacitance and Dielectrics:

Capacitors and Capacitance, Capacitors in Series and Parallel, Energy Storage in Capacitors and Electric-Field Energy, Dielectrics, Molecular Model of Induced Charge, Gauss's Law in Dielectrics

- Current, Resistance, and Electromotive Force:

Current, Resistivity, Resistance, Electromotive Force and Circuits, Energy, and Power in Electric Circuits, Theory of Metallic Conduction

- Direct-Current Circuits:

Resistors in Series and Parallel, Kirchhoff's Rules, Electrical Measuring Instruments, R-C Circuits, Power Distribution Systems

- Magnetic Field and Magnetic Forces:

Magnetism, Magnetic Field, Magnetic Field Lines, and Magnetic Flux, Motion of Charged Particles in a Magnetic Field, Applications of Motion of Charged Particles, Magnetic Force on a

Current-Carrying Conductor, Force and Torque on a Current Loop, The Direct-Current Motor, The Hall Effect

- Sources of Magnetic Field:

Magnetic Field of a Moving Charge, Magnetic Field of a Current Element, Magnetic Field of a Straight Current-Carrying Conductor, Force Between Parallel Conductors, Magnetic Field of a Circular Current Loop, Ampere's Law, Applications of Ampere's Law, Magnetic Materials

- Electromagnetic Induction:

Induction Experiments, Faraday's Law, Lenz's Law, Motional Electromotive Force, Induced Electric Fields, Eddy Currents, Displacement Current and Maxwell's Equations, Superconductivity

- Inductance:

Mutual Inductance, Self-Inductance, Inductors, Magnetic-Field Energy, The R-L Circuit, The LC Circuit, The L-R-C Series Circuit

- Alternating Current:

Phasors and Alternating Currents, Resistance and Reactance, The L-R-C Series Circuit, Power in Alternating-Current Circuits, Resonance in Alternating-Current Circuits, Transformers

- Electromagnetic Waves:

Maxwell's Equations and Electromagnetic Waves, Plane Electromagnetic Waves and the Speed of Light, Sinusoidal Electromagnetic Waves, Energy and Momentum in Electromagnetic Waves, Standing Electromagnetic Waves

TextBooks:

1. D. Holliday, R. Resnick and J. Walker, Fundamentals of Physics, 6th edition, John Wiley, 2000

Title of the Course: Calculus 2
Number of Credits: 3
Type of the Course: Basic | Theoretical
Pre-requisite: Calculus 1
Training hours: 48h Theoretical

Course Objectives:

The main scope of this course is to teach the students some topics in introductory linear algebra including matrix algebra and linear transformations and multivariable calculus including multivariable functions, directional and partial derivatives, velocity and acceleration, tangent plane and normal gradient line, cylindrical and spherical coordinates, vector field and line integrals, surface integral, Green's theorem, Divergence theorem, and Stoke's theorem.

Syllabus of Courses:

Parametric equations; space coordinates; vector and space; numerical product; matrix 3x3 of three-indeterminate linear equations system; operation on lines; matrix reverse; solving equations system; linear independence; base in R2; R3 linear transform and its matrix; determinant 3x3 and characteristic value and vector; vector product; second order line and plane equations; two vector functions and its derivative; speed and acceleration; bending; normal vector to a curve; multivariable function; directional and partial derivative; tangent plane and normal line to a curve; multivariable function; directional and partial derivative; tangent plane and projecting line of gradient; chain of rule for partial derivative; exact differential; second kind and third kind integrals and their application in geometrical and physical problems; transform of integration arrangement (without accurate affirmation); cylindrical and spherical coordinates; vector field; curvilinear integral; surface integral; divergence; curl; Laplacian; potential of green space and divergence and stochastic.

TextBooks:

1. Tom M. Apostol, "Calculus Vol. 2: Multi-Variable Calculus and Linear Algebra with Applications to Differential Equations and Probability", 2012.
2. George B. Thomas and Ross L. Finney, "Calculus and Analytic Geometry (9th Edition)", 1995.

Title of the Course: Engineering Probability and Statistics
Number of Credits: 3
Type of the Course: Basic | Theoretical
Pre-requisite: Calculus 2
Training hours: 48h Theoretical

Course Objectives:

All branches of engineering need powerful analytic tools to deal with uncertainty, model the data/information, and predict and analyze underlying systems. Many of the tools necessary for these analyses have their foundations in probability and statistics. With this in mind, this course provides elementary probabilistic and statistical concepts and the methods to apply them to engineering problems.

Syllabus of Courses:

- Probability (Axioms, Interpretations, and Properties), Counting Techniques, Conditional Probability, Independence, Bayes' Rule

- Discrete Random variables, Probability Mass Function, Probability Distribution Function, Expectation, and Variance

- Especial Discrete Distributions (Uniform, Binomial, Negative Binomial, HyperGeometric, Poisson)

- Continuous Random Variables, Probability Density Function, Probability Distribution Function, Expectation, and Variance, Functions of a Random Variable

- Especial Continuous Distributions (Uniform, Exponential, Gamma, Beta, Weibull, Normal)

- Joint Probability Distributions (Discrete and Continuous Cases), Conditional Distributions, Conditional Expectations, Independence

- Sampling Distributions, Distributions of the Sample Mean, and Sample Variance

- Point Estimation: Maximum Likelihood Method, Method of Moments, Evaluating of Esti-

mators

(Biasedness, Variance, Mean of Squared Errors)

- Interval Estimation: Confidence Intervals for Mean, Variance, and proportion

- Tests of Hypotheses based on a Single Sample (Tests for Mean, Variance, and Proportion, the Concept of P-Value)

- Tests of Hypotheses Based on Two Samples (Test for a Difference between Two Means, Test for a Difference between Two Proportions, Test for the ratio of Two Variances, T-Test for Paired Data)

- Determination of Sample Size in Confidence Intervals and Testing Hypotheses

- Nonparametric Tests (Goodness-of-Fit Test, Test of Independence in Two-Way Contingency Tables)

- Regression (Simple Linear Regression, Normal Regression Analysis, Correlation)

TextBooks:

1. Walpole and Mayers, Probability and Statistics for Engineering and Scientists, 6th edition, Prentice Hall. 1998
2. R.V. Hogg and T. Elliot, Probability and Statistical Inference, 4th edition, Mac Millan, 1993
3. Guttman, I., Wilks, S.S., Hunter, J.S. Introductory Engineering Statistics, J. Wiley, 3rd Ed., 1982.

Title of the Course: Computer Workshop
Number of Credits: 3
Type of the Course: Basic | Practical
Pre-requisite: Introduction to Computing Systems and Programming
Training hours: 48h Practical

Course Objectives:

Familiarity with accessory systems such as card readers, printers, magnetic tape, discs, and consoles, manner of work with terminals, familiarity with compilers and editors, familiarity with JCL language, familiarity with computer organization of a center, familiarity with prepared software packages such as database, spreadsheet, lotus, familiarity with the important programs of a system such as a sort, merge, creation and copy of files, etc., familiarity with usage manner of an operating system of microcomputer

Title of the Course: Discrete Mathematics
Number of Credits: 3
Type of the Course: Major | Theoretical
Pre-requisite: Calculus 1
Training hours: 48h Theoretical

Course Objectives:

Combinatorial reasoning underlies all analysis of a computer system and a discrete mathematics course seeks to develop proficiency in basic discrete math problem-solving in the way that a calculus course develops proficiency in basic analysis problem-solving. This course should teach students to think logically and mathematically, reason and model combinatorially, and use discrete structures. Some important themes interwoven in this course are mathematical reasoning and mathematical induction, combinatorial analysis and enumeration, discrete structures, graphs, and modeling the problems using them.

Syllabus of Courses:

- Induction and Recursion

Mathematical Reasoning, Mathematical Induction, Strong Induction and Well-Ordering, Recursive Definitions and Structural Induction, Recursive Algorithms

- Logics and Proofs

Propositional Logic, Propositional Equivalences, Predicates and Quantifiers, Nested Quantifiers, Rules of Inference, Introduction to Proofs, Proof Methods, and Strategy

- Counting

The Basics of Counting, The Product Rule, The Sum Rule, the Tree Diagram, The Pigeonhole Principle, Permutations and Combinations, Binomial Coefficients, Binomial Theorem, Pascal's Identities and Triange, Vander monde's Identity, Generalized Permutations and Combinations, Permutations with Repetitions, Combinations with Repetitions, Distributing Objects into Boxes, Algorithms For Generating Permutations and Combinations

- Advanced Counting Techniques

Recurrence Relations, Modeling with Recurrence Relations, Fibonacci Numbers, The Tower of Hanoi, Catalan Numbers, Solving Linear Recurrence Relations, Linear Homogeneous Recurrence Relations with Constant Coefficients, Linear Nonhomogeneous Recurrence Relations with Constant Coefficients, Divide-and-Conquer Algorithms, and Recurrence Relations, Formal Power Series, Generating Functions, Counting Problems and Generating Functions, Inclusion-Exclusion, Applications of Inclusion-Exclusion

- Relations

Relations and Their Properties, n-ary Relations and Their Applications, Representing Relations, Closures of Relations, Equivalence Relations, Partial Orderings.

- Graphs

Graphs and Graph Models, Incidence and Adjacency Matrices of a Graph, Graph Terminology and Special Types of Graphs, Complete graphs, Bipartite Graphs, Representing Graphs and Graph Isomorphism, Connectivity, Euler and Hamilton Paths and Circuits, Algorithm to Construct Euler Circuits, Ore's Theorem, Dirac's Theorem, Shortest-Path Problems, Dijkstra's Algorithm, Planar Graphs, Euler's Formula, Kuratowski's Theorem, Graph Coloring

- Trees

Introduction to Trees, Rooted Trees, m-ary Trees, Applications of Trees, Huffman Coding, Tree Traversal, Traversal Algorithms: Preorder, Inorder, Postorder, Spanning Trees, Depth First Search and Breadth First Search Algorithms, Minimum Spanning Trees, Prim's Algorithm, Kruskal's Algorithm

TextBooks:

1. R. P. Grimaldi, Discrete and Combinatorial Mathematics: An Applied Introduction, 5th Edition, Pearson, 2017.
2. K. H. Rosen, Discrete Mathematics and Its Applications, 7th Edition, McGraw-Hill, 2011.
3. S. S. Epp, Discrete Mathematics with Applications, 4th Edition, Brooks Cole, 2010.

Title of the Course: Data Structures
Number of Credits: 3
Type of the Course: Major | Theoretical
Pre-requisite: Advanced Programming
Training hours: 48h Theoretical

Course Objectives:

Familiarity with Information Structures, Effects of Structures in Produced Applications, Selecting Optimized Inside-Memory Structures, and Organizing Memory based on requirements.

Syllabus of Courses:

Arrays, Vectors, matrices and their application, sparse matrices, heap and stack, queue, lists, linked lists (linear, cyclic, doubly and multiply linked lists), introduction to trees, binary trees (decision-making trees, gaming trees, search trees and …), graphs (representation, sweeping and applications), Spanning trees, Dynamic memory allocation methods, searching, sorting and merging algorithms.

TextBooks:

1. Thomas H. Cormen, Charles E. Leiserson, Ronald L. Rivest, Clifford Stein, Introduction to Algorithms, Third Edition, The MIT Press, Cambridge, Massachusetts 2009
2. A.V. Aho, J.E. Hopcroft, J.D. Ullman, Data Structures and Algorithms, Addison Wesley, 1983

Title of the Course: Algorithm Design 1
Number of Credits: 3
Type of the Course: Major | Theoretical
Pre-requisite: Data Structures
Training hours: 48h Theoretical

Course Objectives:

The main purpose of this course is to teach the basic concepts and common methods of analysis and design of algorithms. In this lesson, students learn how to analyze a given problem and find some possible algorithms to solve it. Then analyze and compare those algorithms in terms of computational complexity and identify the best ones based on the characteristics of the input samples. In this lesson, basic algorithms for solving some common problems will be introduced.

Syllabus of Courses:

Review of essential points of Data Structures, problem-solving methods (for each method some problems and a special algorithm for the problem shall be represented and analyzed), introduction to complexity, divide & conquer method (problems to be analyzed: max and min of an array, multiplication of two n-bit number, Strassen method about matrix multiplication, round robin algorithm, sorting with Quicksort algorithm), dynamic programming method (matrix multiplication, traveling salesman problem, polygon triangulation), greedy algorithms(scheduling problem, Huffman Code, making change), methods based on exhaustive search, alpha-beta pruning (puzzle, tic-tac-tac), the revelation of methods for problems, graph algorithms(searching methods of the graph, Dijkstra algorithms, minimum spanning tree, Floyd algorithm, topological sorting and…), maximum flow networks and other problems.

TextBooks:

1. Thomas H. Cormen, Charles E. Leiserson, Ronald L. Rivest, Clifford Stein, Introduction to Algorithms, Third Edition, The MIT Press, Cambridge, Massachusetts 2009.
2. R.E. Neapolitan and K.Naimipour, Foundations of Algorithms using C++ Pseudo Codes, 2nd Edition,
Johns
and
Bartlett
Publishers,
1998.

Title of the Course: Introduction to Computing Systems and Programming
Number of Credits: 4
Type of the Course: Specialized | Theoretical
Training hours: 64h Theoretical

Course Objectives:

Explanation of main computer parts, the concept of software and hardware, algorithms design, and an introduction to a structured computer programming language.

Syllabus of Courses:

Computer fundamentals, including the role of computers in the modern world and their applications. Introduction to main computer parts and the concept of software and hardware. Native data types (Integrals and Floating points). Algorithm design and problem-solving principles (Flow, selection, and loops). Implanting the algorithm by Pseudo Code. An introduction to a structured programming language. Constants, variables, computational and logical expressions. language-specific instructions. Conditional structures. Loops, Arrays, vectors and matrices, functions, and procedures. I/O and files operations. Implementing simple algorithms by the programming language. Searching and sorting. Advanced program design.
Programming language: C/C++

TextBooks:

1. Bjarne Stroustrup, ”The C++ Programming Language”, Addison Wesley, 2004.
2. Stanley B Lippman, ”The C++ Primer”, Addison Wesley, 2005.
3. Paul Deitel & Harvey Deitel, “C++ How to Program (Early Objects Version)”, Prentice Hall; 9 edition, 2013.

Title of the Course: Advanced Programming
Number of Credits: 3
Type of the Course: Specialized | Theoretical
Pre-requisite: Introduction to Computing Systems and Programming
Training hours: 48h Theoretical

Course Objectives:

The purpose of this course is to study the principles and methods (Polymorphism, Inheritance, Program Samples, and other paradigms of programming) necessary to produce a computer program with good-quality specifications. In this regard, after covering the top-down design method to solve the problem, students will be introduced to the concepts and techniques of objectoriented programming as a tool for managing complexity in medium and large-scale applications. Program performance, testing, and debugging are focused on throughout the course. An objectoriented programming language (such as C++) is used to teach these principles and methods, and students are introduced to the concepts and techniques of object-oriented programming and module-based object design, advanced concepts such as graphical user interface design.

Syllabus of Courses:

Introduction: Program life cycle, the importance of programming, programming paradigms, Objected orientation

Object-oriented programming: Description of Objects, Object recognition, Finding implantable objects in problems, Objects connection, Object-oriented programming language, an Introduction to C++ and its history

A review of a functional programming language (C++), Polymorphism, inheritance, program samples

Class and Objects, encapsulation and abstract, C++ classes and their parts (private, public, and protected), constructor and destructors, derived classes

Polymorphism, polymorphism importance, function polymorphism, operator polymorphism

Inheritance: introduction to inheritance, single and multiple inheritances

Templates: template importance, function templates, derived data type templates

Other programming paradigms: introduction to event-oriented and graphical programming, windows programming, client-side programming

Program testing and documentation: the importance of testing and documentation, automatic testing tools, in-line documentation, technical documentation, user manuals

TextBooks:

1. Bjarne Stroustrup, ”The C++ Programming Language”, Addison Wesley, 2004.
2. Stanley B Lippman, ”The C++ Primer”, Addison Wesley, 2005.

3. Paul Deitel & Harvey Deitel, “C++ How to Program (Early Objects Version)”, Prentice Hall; 9 edition, 2013.

Title of the Course: Logic Circuits
Number of Credits: 3
Type of the Course: Specialized | Theoretical
Training hours: 48h Theoretical

Course Objectives:

This course covers the design and analysis of digital logic circuits including combinatorial and sequential logic circuits.

Syllabus of Courses:

Number systems, binary systems, binary codes, addition, subtraction, multiplication and division, Boolean algebra, theorems, logic functions, sum-of-products form, product-of-sums form, Karnaugh maps, logic minimization using K-maps, logic gates (RTL, DTL, TTL) and related topics (FAN-IN, FAN-OUT), combinatorial circuits design, multiplexers, decoders, comparators, sequential circuits design, flip-flops, shift registers, counters, synchronous and asynchronous logic circuits, finite state machines, the timing of sequential circuits
Programming language: Verilog

TextBooks:

1. Morris Mano, Michael Ciletti, Digital Design. 4th ed. Prentice Hall, 2006.
2. Victor Nelson, Troy Nagle, Bill Carroll, David Irwin, Digital Logic Circuit Analysis and Design. 1st ed. Prentice Hall, 1995.

Title of the Course: Electric Circuits
Number of Credits: 3
Type of the Course: Specialized | Theoretical
Training hours: 48h Theoretical

Syllabus of Courses:

Coulomb's, Ohm's, and Kirchhoff's laws; electrostatics and electromagnetics; resistance, capacitance, inductance; series and parallel circuits, independent and dependent voltage and current sources; energy, power; Superposition, Thevenin, and Norton Theorems; DC and AC; initial, steady state and transient conditions; frequency selective circuits and resonance; polyphase circuits and transformers.

TextBooks:

1- W. H. Hayt, J. E. Kemmerly, and S. M. Durbin, Engineering Circuit Analysis, 8th Edition, McGraw Hill, 2011.

2- C. K. Alexander, M. N. O. Sadiku, Fundamentals of Electrical Circuits, 5th Edition, McGraw Hill, 2012

3- A. Agarwal, J. H. Lang, Foundations of Analog and Digital Electronic Circuits, Morgan Kaufmann Publishers, Elsevier, 2005

Title of the Course: Logic Circuits Laboratory
Number of Credits: 1
Type of the Course: Specialized | Practical
Pre-requisite: Logic Circuits
Training hours: 32h Practical

Course Objectives:

The logic circuits laboratory is provided with the logic circuits course and its purpose is to acquaint students with the practical components of logic circuits and how these circuits work and to acquire skills in the development of circuits and digital systems.

TextBooks:

1- C. Roth, L. Kinney, Fundamentals of Logic Design, 7th Edition, Cengage Learning, 2014.

2- F. Vahid, Digital Design with RTL Design, VHDL, and Verilog, 2nd Edition, Wiley, 2011.

Title of the Course: Engineering Mathematics
Number of Credits: 3
Type of the Course: Specialized | Theoretical
Pre-requisite: Calculus 2
Training hours: 48h Theoretical

Course Objectives:

This course provides mathematical techniques in the more advanced areas of mathematics that are of most relevance to engineering disciplines.

Syllabus of Courses:

- Fourier Series, Integrals, and The Fourier Transform

Introduction to Fourier Series, Convergence of Fourier Series and Their Integration and Differentiation, Fourier Sine and Cosine Series, Other Forms of Fourier Series, Frequency and Amplitude Spectra of a Function, Double Fourier Series. The Fourier Integral, The Fourier Transform, Fourier Cosine and Sine Transforms, Sturm–Liouville Problems, Eigenfunctions, and Orthogonality

- Partial Differential Equations

The Method of Characteristics, Wave Propagation and First Order PDEs, Generalizing Solutions, Conservation Laws and Shocks, The Three Fundamental Types of Linear Second Order PDE, Classification and Reduction to Standard Form of a Second Order Constant Coefficient Partial Differential Equation, Boundary Conditions and Initial Conditions, Waves and the OneDimensional Wave Equation, The D'Alembert Solution of the Wave Equation and Applications, Separation of Variables, Some General Results for the Heat and Laplace Equation, An Introduction to Laplace and Fourier Transform Methods for PDEs

- Complex Analysis

Complex Functions and Mappings, Limits, Derivatives, and Analytic Functions, Harmonic Functions and Laplace's Equation, Elementary Functions, Inverse Functions and Branches, Complex Integrals, Contours, the Cauchy–Goursat Theorem, and Contour Integrals, The Cauchy Integral Formulas, Some Properties of Analytic Functions, Complex Power Series and Taylor Series, Uniform Convergence, Laurent Series and the Classification of Singularities, Residues and the Residue Theorem, Evaluation of Real Integrals using Residues, The Inversion Integral for the Laplace Transform, Conformal Mapping, Conformal Mapping, and Boundary Value Problems

- Calculus of Variations

Maximum or minimum of an Integral, Euler's equations, Lagrange's equations, Sturm–Liouville systems, and Rayleigh-Ritz methods.

TextBooks:

1. Michael Greenberg, Advanced Engineering Mathematics, 2nd edition, 1998
2. Erwin Kreyszig, Advanced Engineering Mathematics, tenth edition, 2011

Title of the Course: Technical English
Number of Credits: 2
Type of the Course: Specialized | Theoretical
Training hours: 32h Theoretical

Course Objectives:

This subject aims at raising students' specific language ability in reading and writing academic texts of their major disciplines. The subject will use reading texts from chapters of books or journal articles recommended by teachers of different majors for reading comprehension. These texts will also be used for analysis to enable students to develop an awareness of the genre in that particular discipline.

Title of the Course: Computer Architecture
Number of Credits: 3
Type of the Course: Specialized | Theoretical
Pre-requisite: Logic Circuits
Training hours: 48h Theoretical

Course Objectives:

This course aims to give an understanding of the mechanisms for implementing the programmer's idealized computer. It builds on the introduction to hardware and simple processors in the Digital Systems course. The Computer Architecture course aims to describe a broad range of architectural designs and to contrast them, highlighting the design decisions they incorporate, and how these design decisions impact program performance.

Syllabus of Courses:

C programming language; x86-64 assembly language; Machine representation of programs; Control structures for processors, register transfer level description of hardware; Hardware description languages and simulation in Verilog; Instruction set design, instruction formats, addressing modes, ISAs; A sequential x86-64 design; Processor pipelining, pipeline hazard detection, stalling and forwarding; Out-of-order execution and program performance optimization; RISC and CISC instruction sets (x86-64 and MIPS); Memory hierarchy and memory caches; Microcontrollers for embedded applications; Alternative architectures.

TextBooks:

1. D A Patterson & J L Hennessy, Computer Organization and Design: The hardware/software interface, Morgan-Kaufmann (Fifth edition) 2013.

Title of the Course: Machines and Language Theory
Number of Credits: 3
Type of the Course: Specialized | Theoretical
Training hours: 48h Theoretical

Course Objectives:

A presentation of the theory of computing, including coverage of the theory of formal languages and automata, compatibility, computational complexity, and deterministic parsing of context-free languages.

TextBooks:

1. Sipser. Introduction to the Theory of Computation. PWS Publishing company, 1997.
2. Linz, An Introduction to Formal Languages and Automata. 3rd edition ed., Jone,s and Bartlett Publishers, 2001.

Title of the Course: Operating System
Number of Credits: 3
Type of the Course: Specialized | Theoretical
Pre-requisite: Computer Architecture
Training hours: 48h Theoretical

Course Objectives:

The course provides computer engineering students to understand the ways that applications interact with the computer hardware as well as different methods of resource management and their respective algorithms. Further, they will learn of basic mechanisms which are used in the low-level management of computer systems. Such a student will also learn how to design a system with the consideration of both hardware and software characteristics and limitations and improve the quality of programs. The course is a combination of both practice and theory. Upon successful completion of the course, students will have good insights 1. in different types of computer systems and applications, 2. to design, build, and manage system software, 3. to better discover the reasons for the degraded performance of computer systems and solve the problem, 4. to propose and implement resource management policies.

Syllabus of Courses:

1) Introduction (Basic terminologies and concepts as well as different computer systems architectures and software systems, Interrupts, Dual-mode, …)

2) Operating system structures (Different architectures for operating systems, system calls, APIs, virtualization, and cloud computing)

3) Processes (PCB, context switch, short-term, medium-term, and long-term schedulers, process creation and communication)

4) Threads (Multithreading models, thread management)

5) Process synchronization (Critical sections and respective solutions, semaphores, monitors, classic synchronization problems)

6) CPU scheduling (Preemptive and non-preemptive scheduling, CPU scheduling algorithms, SMP, SMT, multicore scheduling, real-time scheduling)

7) Deadlock handling (Necessary conditions for deadlock, resource-allocation graph, deadlock prevention, avoidance, detection, and recovery)

8) Main memory management (Binding, physical and logical addresses, fragmentation, paging, TLB, shared pages, segmentation)

9) Virtual memory management (Demand paging, page fault handling, copy-on-write, page replacement policies, Belady’s anomaly, frame allocation, thrashing, memory-mapped I/O and files, kernel memory management)

10) Storage management (File system structure, virtual file system, storage allocation methods)

11) I/O management (Interrupts, I/O subsystem, I/O management and performance aspects)

TextBooks:

1. W. Stallings, Operating Systems, 4th Edition, Prentice Hall, 2001
2. Silberschatz, J.L. Peterson, Operating Systems Concepts, Addison Wesley, 2000 Course

Title of the Course: Artificial Intelligence
Number of Credits: 3
Type of the Course: Specialized | Theoretical
Training hours: 48h Theoretical

Course Objectives:

AI is an introductory course in Artificial Intelligence. The goal is to acquire knowledge of intelligent systems and agents, formalization of knowledge, reasoning with and without uncertainty, machine learning, and applications at a basic level.

Syllabus of Courses:

Intelligent agents | Problem-solving, complexity metrics | Uninformed search (BFS, DFS, Uniform cost, depth-limited, iterative deepening) | Informed search (Greedy, A*) | Another search (simulated annealing, genetic algorithms) | Game playing (minimax, alpha-beta pruning, nondeterministic games) | Knowledge-based agents | Propositional logic, syntax, semantics, inference, limitations | First-order logic (including inference, unification, Goedel's theorem, generalized modus ponens, resolution, forward chaining, backward chaining, situation calculus) | Building a knowledge base (ontologies, translation between English and FOL, difficult cases like events, substances, composite objects) | Logical reasoning systems (Implementing indexing, retrieval, and unification. Theorem provers. Frame systems and semantic networks) | Planning (including STRIPS) | Uncertainty | Decision Trees | Fuzzy logic | Neural networks (including Hopfield, perceptrons, backpropagation)

TextBooks:

1. Artificial Intelligence: a modern approach, S. Russell and P. Norvig, Prentice Hall.

Title of the Course: Operating Systems Laboratory
Number of Credits: 1
Type of the Course: Specialized | Practical
Training hours: 32h Practical

Course Objectives:

The goal of this course is to create the right understanding and to learn the techniques of designing and implementing system programs and operating systems based on an open-source operating system. Students will get familiar with the implementation of basic design concepts of the operating system, such as file management, process management, kernel-level programming, and process synchronization in an open-source operating system, and learn to install and manage an open-source operating system. Upon successful completion of the course, students will be able to 1. Compile, install, and manage an open-source operating system 2. Implement the basic concepts of designing operating systems in an open-source operating system 3. Program in kernel-level

Syllabus of Courses:

1) Introduction: An overview of Linux including its history, versions, Posix, Graphical User Interface

2) Install and compile a version of Linux: Disk partition, compile, boot load, and use the application menu and system.

3) Linux file system

4) Standard and advanced Shell

5) Managing Processes and Threads

6) Processor scheduling in Linux

7) Deadlock synchronization

8) Memory management

Title of the Course: Computer Aided Digital System
Number of Credits: 3
Type of the Course: Specialized | Theoretical
Training hours: 48h Theoretical

Course Objectives:

Students in the Computer Aided Digital System course will implement and test digital circuits ranging in complexity from basic logic gates to state machines that perform useful functions like calculations, counting, timing, and a host of other applications.

Title of the Course: Signals and Systems
Number of Credits: 3
Type of the Course: Specialized | Theoretical
Pre-requisite: Engineering Mathematics
Training hours: 48h Theoretical

Course Objectives:

Introduction to the fundamentals of continuous and discrete time signal and system analysis. This course will cover linear system analysis including impulse response and convolution, Fourier series, Fourier transforms, sampling, discrete-time signal and system analysis, and Z-transforms. The student is expected to demonstrate the ability to: - Apply the convolution theorem for continuous-time signals - Evaluate the Fourier Series of periodic signals - Determine the Fourier Transform of energy signals - Make use of Fourier Transform Properties - Analyze a discrete-time LTI system using discrete linear convolution - Use Z-transform for analyzing discrete-time signals and systems - Convert a continuous-time signal to the discrete-time domain and reconstruct using the sampling theorem

Syllabus of Courses:

- Introduction

Motivation: Why signal processing is important, Mathematical preliminaries

- Signal Basics

Types of signals, Elementary signals

- Time-Domain Analysis of Continuous-Time Systems

Types of systems, Linear time-invariant (LTI) systems, Convolution

- Continuous-Time Fourier Series (CTFS)

CTFS derivation, CTFS properties, Convergence

- Continuous-Time Fourier Transform (CTFT)

CTFT derivation, CTFT properties, CTFT, convolution, and LTI systems, Convergence

- Laplace Transform

Region of convergence, Implementing continuous-time systems

- Time-Domain Analysis of Discrete-Time Systems

Types of systems, Linear time-invariant (LTI) systems, Convolution

- Time-Domain Analysis of Discrete-Time Systems

Types of systems, Linear time-invariant (LTI) systems, Convolution

- Discrete-Time Fourier Transform (DTFT)

DTFT derivation, DTFT properties, DTFT, convolution, and LTI systems, Convergence

- Discrete Fourier Transform (DFT)

DFT, convolution, and LTI systems, Convergence, Fast Fourier Transform (FFT)

- Sampling and Reconstruction

Sampling and the Nyquist theorem, Sinc interpolation, Practical reconstruction

- Z-Transform

Region of convergence, Implementing discrete-time systems

TextBooks:

1. Alan V. Oppenheim, A. S. Willsky and S. Hamid Nawab, Signals and Systems, 2nd ed., Prentice-Hall, 1996.
2. S. Haykin and B. Van Veen, Signals and Systems, 2nd ed., Wiley, 2003.

Title of the Course: Compiler Design and Programming Languages
Number of Credits: 3
Type of the Course: Specialized | Theoretical
Pre-requisite: Machines and Language Theory
Training hours: 48h Theoretical

Course Objectives:

Designing and building compilers is one of the basic concepts of computer science. Although there is little variety in the way compilers are made, a wide variety of languages and machines can be used to make interpreters and translators. In this lesson, the subject of building compilers is introduced by describing the main components of a compiler, their tasks, and their relationship. After an introductory introduction to the components of a compiler and the types of grammar, the various stages of translation, such as lexical, syntactic, and semantic analysis, and code generation and payment, are described. Students who successfully pass this course will have a good insight into the following: Familiarity with compiler components and various techniques for their implementation, understanding of the implementation of programming language commands, gaining skills in producing optimal programs and fixing programming errors, familiarity and the use of automated tools in compiler production.

Syllabus of Courses:

An introduction to the design and implementation of programming language translators,

Theoretical aspects of language design and translation are discussed, and practically demonstrated by developing a working compiler.

TextBooks:

1. A. Aho, M. Lam, R. Sethi, and J. Ullman, Compilers: Principles, Techniques, and Tools (2nd Edition), Prentice Hall, 2006.

Title of the Course: Computer Networks
Number of Credits: 3
Type of the Course: Specialized | Theoretical
Training hours: 48h Theoretical

Course Objectives:

The purpose of this course is to become familiar with the principles and practice of data networking; learn how to write applications that use the network; get some understanding of network internals in a hands-on way; explain the OSI model; recognize the primary network protocols and distinguish between centralized, client/server, and peer-to-peer systems; and distinguish between Local Area Networks (LANs) and Wide Area Networks (WANs) and identify the components used to expand a LAN into a WAN. Upon successful completion of the course, students will be able to: 1. To master the terminology and concepts of the OSI reference model and the TCP-IP reference model.

Syllabus of Courses:

Review of fundamental concepts in networking and the Internet

1. Internet protocols and components in the edge and the core of the network
2. Performance concepts such as queue, delay, loss, and throughput
3. Layered architecture

Application Layer

1. Web and HTTP protocol
2. Electronic Mail and SMTP protocol
3. Internet’s Directory Service and DNS protocol
4. P2P applications and P2P file distribution
5. Video streaming and DASH protocol
6. Content distribution and Cache
7. Socket programming

Transport Layer

1. Multiplexing and demultiplexing
2. UDP protocol
3. Principles of reliable transfer and GBN and SR protocols
4. TCP protocol, round-trip time estimation, and flow control
5. Principles of congestion control

Network Layer: Data Plane

1. Data and control planes
2. Router architecture
3. Addressing, IPv4 and IPv6

4. Network address translation and NAT protocol
5. Generalized forwarding (SDN) and OpenFlow protocol

Network Layer: Control Plane

1. LS and DV routing algorithms
2. Intra-AS routing and OSPF protocol
3. Inter-AS routing and BGP protocol
4. SDN control plane
5. ICMP and SNMP protocols

Data Link Layer and LANs

1. The data link layer services
2. Error-Detection and –Correction techniques
3. Multiple access protocols
4. Local area networks, Ethernet, ARP protocol, and VLAN protocol
5. Link virtualization and MPLS protocol
6. Data center networking

TextBooks:

1. Computer Networking: a top-down approach / James F. Kurose, Keith W. Ross.6th ed, 2013. 2. Computer networks / Andrew S. Tanenbaum, David J. Wetherall. 5th ed, 2011.

Title of the Course: Electrical Measurement and Circuit Laboratory
Number of Credits: 1
Type of the Course: Specialized | Practical
Pre-requisite: Electric Circuits
Training hours: 32h Practical

Course Objectives:

In this laboratory, students are familiar with the electronic elements of resistors, capacitors, and inductors, and the operation of electrical measuring devices such as multimeters and oscilloscopes, as well as other devices used in electrical and electronic circuits such as power supply and signal generators, as well as measuring parameters such as current. They learn voltage, frequency, periodicity, phase difference, and power.

Title of the Course: Computer Architecture Laboratory
Number of Credits: 1
Type of the Course: Specialized | Practical
Pre-requisite: Computer Architecture
Training hours: 32h Practical

Course Objectives:

The purpose of this laboratory is to acquaint students with the concepts presented in the computer architecture course such as designing digital circuits, how to analyze and debugging them, designing logic and arithmetic parts of a processor, designing memory units, input/output, data path, and control unit in a typical processor, Using hardware description languages such as Verilog and VHDL to describe their structure, synthesize and finally implement on FPGA boards.

TextBooks:

1. S. Brown, Z. Vranesic, Fundamentals of Digital Logic with Verilog Design, McGraw-Hill, 2003.
2. B. Parhami, Computer Arithmetic, Algorithms and Hardware Designs, Oxford University Press, 2000.

Title of the Course: Information Technology Project Management
Number of Credits: 3
Type of the Course: Specialized | Theoretical
Training hours: 48h Theoretical

Course Objectives:

This course provides participants with the necessary knowledge, tools, and techniques needed to manage and control projects. It deals with all the processes necessary to plan, manage, execute, and control projects.

Title of the Course: Computer Networks Laboratory
Number of Credits: 1
Type of the Course: Specialized | Practical
Pre-requisite: Computer Networks
Training hours: 32h Practical

Course Objectives:

The objective of this lab course is to get practical knowledge of the working principles of various communication protocols. Analyse structure and formats of TCP/IP layer protocols using network tools such as Wireshark and network simulators.

TextBooks:

1. J. F. Kurose, Keith W. Ross, Computer Networking: A Top-Down Approach, 7th Edition, Pearson, 2016

Title of the Course: Real Time Embedded Systems
Number of Credits: 3
Type of the Course: Specialized | Theoretical
Training hours: 48h Theoretical

Course Objectives:

This course provides an overview of the unique concepts and techniques needed to design and implement computer systems having real-time response requirements in an embedded environment. It contrasts the concepts and techniques of real-time and embedded systems with those of more traditional computer systems. Topics include Basic concepts of real-time and embedded systems, hardware features, sensors and actuators, programming languages, real-time operating systems, synchronization techniques, performance optimization, and current trends in real-time and embedded systems such as incorporating internet connectivity.

TextBooks:

1. E. A. Lee, S. A. Seshia, Introduction to Embedded Systems – A Cyber-Physical System Approach. MIT Press, 2016.
2. P. Marwedel, Embedded System Design (Embedded System Foundation of Cyber-Physical System), Springer, 2011.
3. R. Love, Linux Kernel Development, 2nd Edition, Novell, 2005.
4. S. Seiwert, Real-Time Embedded System and Components, Thomson Learning Inc, Charles River Media, 2007.

Title of the Course: Research and Technical Presentation
Number of Credits: 2
Type of the Course: Specialized | Theoretical
Training hours: 32h Theoretical

Course Objectives:

In this course, students learn systematic research methods and techniques, and skills in presenting scientific and technical materials. By choosing a subject, students must go through various stages of compilation and submit a written presentation for it, and in doing so, use information networks and computer publishing tools. In this course, students will learn the importance and role of rhetoric in mass communication and will be able to strengthen their sense of self-confidence by presenting oral material. Students learn different styles of expression and eloquence and gain the ability to analyze, critique, and evaluate different types of oral communication. Students must provide several lecture sessions in the classroom.

Title of the Course: Systems Analysis and Design
Number of Credits: 3
Type of the Course: Elective | Theoretical
Training hours: 48h Theoretical

Course Objectives:

Just as solving a mathematical problem requires first identifying its complexities and dimensions, designing appropriate strategies to solve the problem, and then proceeding to solve it, such as building computer systems for a set of people (which in many cases may be more complex mathematical problems) also need to be analyzed and designed before implementation. In this course, students are introduced to analysis and design skills such as requirements analysis, feasibility analysis, modeling, process analysis, architectural design, and UI / UX. In addition to these skills, this course will include computer systems management and production planning skills such as production methods, process automation, and project management concepts in such projects.

TextBooks:

1. L.D. Bentley, K.C. Dittman, and J.L. Whitten. Systems analysis and design methods.

Irwin/McGraw Hill, 2007.

2. K.S. Rubin. Essential Scrum: A practical guide to the most popular Agile process. AddisonWesley, 2012.

3. M. Fowler, C. Kobryn, and K. Scott. UML distilled: A brief guide to the standard object modeling language. Addison-Wesley Professional, 2004.

Title of the Course: Database Design
Number of Credits: 3
Type of the Course: Elective | Theoretical
Training hours: 48h Theoretical

Course Objectives:

This course introduces relational database systems. In this course, the students will learn how to design and create relational databases and how to use them. They will also learn about the internals of database management systems: how such systems store data, optimize and execute queries, and process transactions. Upon successful completion of the course, students will be able 1. to understand the basics of a database system and its architecture 2. to design a database for an application: draw an entity-relationship (ER) diagram from a problem specification, convert the ER diagram to relations, and normalize the relations 3. to write database queries in SQL 4. to write relational algebra and relational calculus expressions for queries 5. to understand how the relations and indexes are stored in a database system 6. to identify useful indexes for a specific database and workload 7. to understand how the queries are optimized and executed in a DBMS 8. to understand concurrency control and recovery in database systems

Syllabus of Courses:

Foundations

1. The relational model
2. Relational Algebra and Relational Calculus
3. SQL: Queries, Constraints, Triggers
4. Schema Refinement and Normal Forms

Storage and Indexing

1. Storing Data: Disks and Files
2. Tree-Structured Indexing
3. Hash-Based Indexing

Query Evaluation

1. External Sorting
2. Evaluating Relational Operators
3. A Typical Relational Query Optimizer

Transaction Management

1. Overview of Transaction Management

TextBooks:

1. R. Ramakrishnan and J. Gehrke, Database Management Systems, McGraw-Hill 3rd Edition, 2003.

Title of the Course: Internet Engineering
Number of Credits: 3
Type of the Course: Elective | Theoretical
Pre-requisite: Computer Networks
Training hours: 48h Theoretical

Course Objectives:

The goal of this course is to cover the basic techniques in developing Web-based and Internetbased programs. Also, important points in the architectural design of a system on an Internet-scale are examined. In addition, creating Web services, Web 2 concepts and semantic web, social networks and cloud computing on the Web will also be the subject of this lesson. Another aspect of this lesson is the provision of web software's quality requirements such as performance, scalability, portability, security, and usability. Students who complete this lesson will be able to: 1. Develop web-based software 2. Respond to architectural challenges in creating Internet-scale applications 3. Use the web as a platform for the development of applications 4. Apply technology frameworks to meet the quality needs of web applications

Syllabus of Courses:

1) An Introduction to Web- HTTP protocol - Web page design

2) Create simple web applications (based on Servlet, PHP, or . NET)

3) 3-tier architectural pattern

4) Connection to Databases - Mapping Objects to Relations

5) Domain logic organization

6) Frameworks and layout patterns on the web

7) Manage Sessions

8) Concurrency control on web systems

9) Distributed web systems

10) Clustering and cloud computing

11) Web application security

12) Create Authenticated Web Sites

13) Performance of Web-based systems

14) Web services

15) Semantic web, social networks

16) User interface design on the web

17) Mobile programming on the web

Title of the Course: Financial Literacy and Personal Finance
Number of Credits: 2
Type of the Course: Elective | Theoretical
Training hours: 32h Theoretical

Course Objectives:

Financial Literacy and Personal Finance course gives students the knowledge and skills needed to make informed financial decisions, develop sound financial habits, and manage money effectively. This course can help students finance their education, purchase a home, or cover medical expenses. In other words, it can help them reach their goals and maintain financial stability regardless of life's ups and downs.

Title of the Course: Software Engineering
Number of Credits: 3
Type of the Course: Elective | Theoretical
Training hours: 48h Theoretical

Course Objectives:

The purpose of this course is to study the techniques needed to produce valuable, high-quality high-productivity software. In this lesson, first, the differences between a product that is produced by the engineering method and a product that is produced by the artistic methods are expressed. Then the expectations that an engineering product has to meet are described. Afterward, we will have an overview of scientific achievements in this field at all stages of software products with an emphasis on engineering methods of production, including modeling, measurability, evaluability, validation, and verification. Given the fact that in previous courses students have been less familiar with the formal descriptions of requirements, measurements, estimates, and tests, this course focuses more on these subjects. In the end, support activities such as project management, scheduling, risk management, configuration management, and quality assurance, with emphasis on their impact on software products, are reviewed. Students who successfully pass this lesson will have a good insight into the following: 1. Applying engineering methods to create a quality product 2. Follow the well-known processes of software engineering 3. Application of Software Architectural Design Methods 4. Software Testing at Different Levels

Syllabus of Courses:

1. An Introduction to Software Engineering
2. Software Development Processes and Models – Iterative Development
3. An overview of software analysis
4. Software design: design principles, patterns, refactoring
5. Software Architecture: Design, Documentation, and Evaluation
6. Software testing
7. Software Quality Management
8. Cost and time estimation
9. Project Management - Human Resources Management - Risk Management
10. Life Cycle Management - Change Management – Configuration Management
11. Agile methods

TextBooks:

1. Roger S. Pressman and Bruce R. Maxim, Software Engineering: A Practitioner’s Approach. 8th ed., McGraw-Hill, 2014.

Title of the Course: Parallel Programming
Number of Credits: 3
Type of the Course: Elective | Theoretical
Training hours: 48h Theoretical

Course Objectives:

This course is about writing effective programs to harness the unprecedented power provided by modern parallel computers so that the programs attain the highest possible levels of performance the machines are capable of. The parallel computers we focus on include multi-core processors as well as clusters and supercomputers made from them. The programming systems and methodologies we learn will include OpenMP, Pthreads and CUDA. However, the focus of the course is not so much on the mechanics of these programming systems as on how to use them to attain and improve high performance. This performance orientation pervades throughout the course and is enhanced by several case studies, small enough to understand the lecture format yet complex enough to illustrate performance issues and trade-offs. The course also teaches an adequate analytical framework for understanding performance, including performance models, scalability analysis, and iso-efficiency.

Title of the Course: Operational Research
Number of Credits: 3
Type of the Course: Elective | Theoretical
Training hours: 48h Theoretical

Course Objectives:

Operations Research is a discipline that involves the development and application of advanced analytical methods to aid complex decisions. This course will provide students with the skills to be able to apply a variety of analytical methods to a diverse set of applications. By achieving these objectives, students will be equipped with the necessary knowledge and skills to apply operational research techniques in a wide range of practical situations. They will be prepared to analyze complex systems, optimize decision-making processes, and contribute to organizational efficiency and effectiveness in various domains, including business, engineering, healthcare, logistics, and finance.

Syllabus of Courses:

1. Introduction to Operational Research
2. Constraint Programming
3. Dynamic Programming
4. Unconstraint Non-Linear Programming
5. Integer Programming
6. Linear Programming

Title of the Course: Computer Networks Security
Number of Credits: 3
Type of the Course: Elective | Theoretical
Pre-requisite: Computer Networks
Training hours: 48h Theoretical

Course Objectives:

Computer networks security is a course designed to teach students about the fundamental concepts and techniques used in securing computer networks. With the increasing reliance on computer networks in modern society, network security has become a crucial aspect of information technology. This course provides an overview of the principles, practices, and technologies used in computer networks security. The course covers a variety of topics, including cryptography, authentication, access control, firewalls, intrusion detection and prevention, virtual private networks (VPNs), and secure network design. Students will learn about the types of vulnerabilities and attacks that can affect computer networks and the ways to prevent and respond to such attacks. The goals of this course are: 1. Learning the fundamentals of cryptography 2. Learning the security protocols used in computer networks 3. Learning how security protocols are broken and hacked Upon successful completion of the course, students will be able to 1. Do basic encryption/decryptions 2. Design secure protocols 3. Analyze the security of protocols 4. Use existing standards to secure the computer networks

Syllabus of Courses:

1- Fundamentals of Cryptography

2- Fundamentals of Computer Networks

3- Key Management

4- Authentication

5- Internet Security

- Web

- Firewall

- Email

- IDS

- VPN / IPSec

- DNS Security

6- Wireless Security

7- Access Control

8- Malware and Attacks

TextBooks:

1. “Network Security Essentials: Applications and Standards”, William Stallings, 6th ed., Pearson,

2017

Title of the Course: Knowledge of the Environment
Number of Credits: 2
Type of the Course: Elective | Theoretical
Training hours: 32h Theoretical

Course Objectives:

Knowledge of the Environment is a course designed to provide students with an understanding of the principles and practices of environmental science. This course is critical for students who wish to pursue careers in environmental science, natural resource management, or sustainability. Throughout the course, students will learn about the fundamental concepts of environmental science, including ecological principles, biogeochemical cycles, and biodiversity. Students will gain an understanding of environmental problems and the tools and techniques used to analyze and solve environmental problems. The course will cover topics such as sustainable development, climate change, pollution, conservation, and environmental policy.

Title of the Course: Database Laboratory
Number of Credits: 1
Type of the Course: Elective | Practical
Pre-requisite: Database Design
Training hours: 32h Practical

Course Objectives:

The course aims to cover the fundamentals of databases as seen from the perspective of application writers. The course covers schema design techniques, SQL, data warehouses, and some aspects of the NoSQL movement. Also, students will explain the client/server model, and describe the key components used to implement internet database environments and perform basic database administration tasks.

Title of the Course: Introduction to Software Testing
Number of Credits: 3
Type of the Course: Elective | Theoretical
Pre-requisite: Computer Networks
Training hours: 48h Theoretical

Course Objectives:

The purpose of this course is to acquaint students with test methods and especially test data production methods. Also in this course, the necessary tools for the software test are introduced.

Syllabus of Courses:

Introduction to testing methods, Coverage criteria, Graph-based criteria, Criteria based on logic, Criteria are based on the separation of the input space, Syntax-based criteria, Practical considerations of software testing, Test tools and software setup for testing.

TextBooks:

1. P. Ammann, J. Offutt, Introduction to software testing, Cambridge University Press, 2016.
2. P. C. Jorgensen, Software Testing: A Craftsman’s Approach, 2nd Edition, CRC Press, 2002.

Title of the Course: Project
Number of Credits: 3
Type of the Course: Specialized | Practical
Training hours: 120h Practical

Course Objectives:

Students choose a professor of the computer engineering department and he/she defines a subject such as implementing a program on special scientific usage or a subject in computer engineering to research that, and students must provide an essay and submit their project result and present it.

Title of the Course: Industrial Training
Number of Credits: 3
Type of the Course: Training | Practical
Training hours: 240h Practical

Course Objectives:

Students must practically get involved in industry and market by working totally specific hours in an appropriate and defined company in either governmental or private sectors as an intern.

Title of the Course: Islamic Revolution in Iran
Number of Credits: 2
Type of the Course: General | Theoretical
Training hours: 32h Theoretical

Course Objectives:

Theoretical acquaintance with the causes and factors of the Islamic Revolution and analytical study of cultural, social, and political developments of the Islamic Revolution and subsequent issues.

Title of the Course: Islamic Thoughts 1 (Beginning and Resurrection)
Number of Credits: 2
Type of the Course: General | Theoretical
Training hours: 32h Theoretical

Course Objectives:

Explain the necessity of Muslim students to pay attention to religion and religious categories, deepen and expand information and strengthen students' theism and faith in the field of theology and resurrection.

Title of the Course: Analytical History of Beginning Islam
Number of Credits: 2
Type of the Course: General | Theoretical

Training hours: 32h Theoretical

Course Objectives:

Familiarity of students with how Islam emerged and spread and the way of transition from an ignorant society to an Islamic society.

Title of the Course: Thematic Interpretation of the Quran
Number of Credits: 2
Type of the Course: General | Theoretical
Training hours: 32h Theoretical

Course Objectives:

Familiarity with some life-giving concepts of the Holy Quran in the form of a thematic attitude.

Title of the Course: Persian Language
Number of Credits: 3
Type of the Course: General | Theoretical
Training hours: 48h Theoretical

Course Objectives:

Familiarity with the Persian language and reading literary texts, poetry, and prose in Iranian Persian literature.

Title of the Course: Physical Education
Number of Credits: 1
Type of the Course: General | Practical
Training hours: 32h Practical

Course Objectives:

Physical Education classes are designed to practice and develop skills in activities that will help you maintain fitness throughout your life. During the year, you will set and monitor personal fitness goals that will aid in the development of a personal fitness plan.

Title of the Course: English Language
Number of Credits: 3
Type of the Course: General | Theoretical
Training hours: 48h Theoretical

Course Objectives:

General Language courses, offered at all levels of the Intensive Language Program, seek to improve students' Language skills in a great variety of discourse settings. Language skills addressed include

listening, fluency development, oral intelligibility, reading, grammar, writing, and vocabulary development.

Title of the Course: Family Schematization and Population
Number of Credits: 2
Type of the Course: General | Theoretical
Training hours: 32h Theoretical

Course Objectives:

Familiarity of students with the basics of family knowledge and how to form, consolidate, and excel it as demographic characteristics and their role in improving the quality of life.

Title of the Course: Islamic Thought 2 (Prophethood and Imamat)
Number of Credits: 2
Type of the Course: General | Theoretical
Training hours: 32h Theoretical

Course Objectives:

Becoming familiar with instructions in Islam, continuing ”Islamic Thought I” discussions. Expanding students’ knowledge about religion, prophethood, Islam, Imamat, and leadership, which is divided into three sections.

Title of the Course: Islamic Ethics (Principles and Concepts)
Number of Credits: 2
Type of the Course: General | Theoretical
Training hours: 32h Theoretical

Course Objectives:

Familiarity of students with the principles and concepts of Islamic ethics in the field of moral virtues and vices, to acquire virtues and avoid moral vices.

Title of the Course: Sport 1
Number of Credits: 1
Type of the Course: General | Practical
Training hours: 32h Practical

Course Objectives:

This course is designed for the prospective coach, physical education, and/or recreation professional.
